

Issue 29

# TAP

Oct. 1975

A lack of staff has prevented the newsletter from being published as often as we would have liked. However, we are attempting to remedy this situation by opening a New York office where prospective volunteers can help to put out the newsletter. In addition, readers can come in to ask questions, donate articles and information, obtain subscriptions and back issues without using the mails, and meet other readers. Due to the sensitive nature of our publication, we must insist that no materials of an illegal nature accompany you when you visit us. Until further notice the office will only be open at the hours and days listed below.

Address: 1201 Broadway (Between 28th and 29th Street)  
Room 608

Many readers have difficulty obtaining parts for our projects in TAP. Most parts can be obtained from mail-order companies such as those below. To read their catalogs is an education in itself.

Babylon Electronics, P. O. Box J, Carmichael, Ca. 95608  
B&F Enterprises, P. O. Box 44, Hathorne, Mass. 01937 (617)532-2323  
Burstein-Applebee, 3199 Mercier, Kansas City, Mo. 64111 (816) 531-5614  
Digi-Key, P. O. Box 126, Thief River Falls, Minn. 56701  
H. J. Knapp Co., 3174 8th Ave., S. W., Largo, Fla. 33540 (813)584-0034  
Lafayette Electronics, 111Jericho Tpk., Syosset, N. Y. 11791 (516)921-7777  
PolyPaks, P. C. Box 942, South Lynnfield, Mass. 01940 (617) 245-3829  
Solid State Systems, P. C. Box 773, Columbia, Mo. 65201 (314)443-3673

TAP has courses on Basic Electricity that are easily understood, no matter how little knowledge of Electronics you already have. You learn by building useful projects and experiments such as those in TAP. In fact, you should be able to build any project in TAP after 6 courses, which are 50¢ each (free if you can't afford it). 4 courses are available now, A-Basic Electricity, B-Alternating current, C-Basic Phones, and D-Amplifiers, with more coming soon. We urge you to send for them if you want a quick education in electronics.

**YOU CAN HELP TAP**

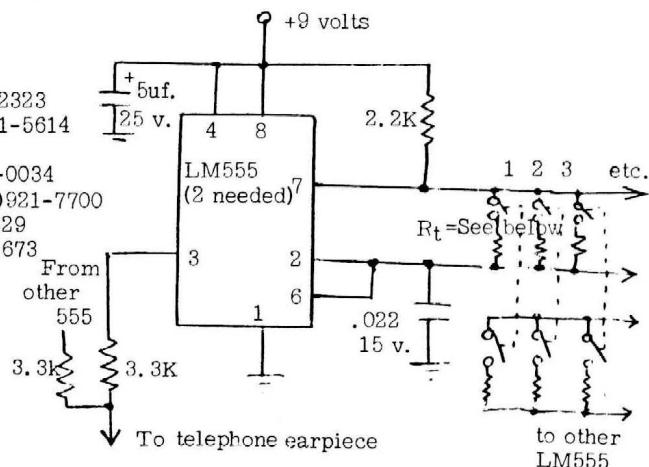

If you can contribute any information that you think other readers would be interested in, please do so. TAP readers are the main source of our information. You can help by meeting employees of phone and power companies, alarm places, etc., and asking them about questions other people raise in the newsletter. Be sure to get details and maintain contact in case you have additional questions. Most employees of those companies would be glad to screw their boss and they'd probably be interested in TAP, too. We hope that a lot of you will gather information so we know what the scene is around the country and Canada.

We also need info on the following:

Automatic Blue Boxes-With info about where they're necessary.  
Vending Machines-Locks, getting stuff, etc.  
Locks-New code books, picking Medeco, Sargent Keso, tricks, etc.  
Radio-Setting up your own Station, Schematics, legal stuff, jammers, etc.  
Burglar Alarms-Holmes and other central station alarms bypassing, electronic keys and picking, etc.  
Also, Magnets, Overseas Phreaking, and Chemistry.

## **ADVANCED BLUE BOX**

This circuit was sent in by a reader and we've checked it out to find that it's beautifully stable with voltage and temperature (assuming the capacitor .022 is stable). The 8038 circuit in issue #26 is very convenient but it requires a voltage regulator IC. This circuit does not. It uses a 555 timer, which, used in the free-running mode generates a square wave, which is ok for two reasons: First, the phone line, earpiece and telephone mouthpiece you're using can't reproduce a square wave so it's shaped somewhat into a sine wave, and secondly this circuit makes up for it's wave-shape by its excellent frequency stability. It needs double-pole buttons, admittedly a hassle to obtain, however it of course needs no diode matrix. Current drain is under 20 ma. for two 555s.

Approximate value for  $R_t$  (Use trimmers)

Hz	R <sub>t</sub>	
700	42k	For example: 700 Hz- use 50k trimmer pot, 10 or 20 turns, or else use a
900	35k	single turn 5k or 10k pot in series
1100	28k	with a resistor, so that the center of
1300	24k	the pot(1/2 the value) plus the resis-
1500	22k	tor equals 42k. Thus a 10k pot at its
1700	18k	center is 5k, plus 37k =42k
2600	12k	

Build two duplicate circuits, connect outputs, ground, and power. Can drive a telephone earpiece strongly. Remove the varistor dual-diode on the earpiece before using.

## Letters From Readers

Dear TAP,  
A modified Starrett #29B small hole gauge-available from most machine supply companies-is an effective key for the Rollersmith lock (See Issue #26 and #22). Accept no substitutes-General makes a similar tool but it is of lower quality and may require a special order. The page is hardened steel, so you'll have to use a small bench grinder, not a file, to reduce the diameter of the ball halves and come to about .150" (That's one hundred and fifty-thousands of an inch) underscored. Finish grinding by hand on a ceramic stone until it just enters the hole. Insert all the way, tighten, and retract it, and Voila! The lock is opened.

The gauge costs about \$7 and can be sold at a nice profit.

Be sure to ground the manufacturer's name and number off the gauge to insure its anonymity.

Mr. Phelps  
Advisable Missions Force

Note: Grind with gauge un-reversed.

Dear TAP,  
A good way to nail those anti-phone preak manufacturers is to go to a Pay phone and call one up. It is not necessary to pay, instead, simply call the operator and tell her that you just dialed a wrong number. In most cases, if you are convincing, she will connect you. When the company answers, have nice long talk about how good you think their device is to protect life, limb and property. Sound sincere, and stay on for as long as possible or until an operator comes on. Almost always, after using the "wrong number" approach, the operator will forget about you, and by the time she remembers, you will already have run up a huge bill (staying on for an hour across country) will come to over \$20. When you think you must, hang up, making sure you've left no clue to your identity. The operator will call back, and ask you to deposit an amount equal to GM's call back, and smash the State.

"yearly sales. By this time, you will be long gone, so guess we're stuck with the bill?" That's right, the good old manufacturer!

### NEW JERSEY

Dear TAP,  
Wisconsin Telephone Newsline is a pretty typical Telco newslime, except they have a mania for phone breakups. They always have the latest on just across the country, as well as up-tight references to publications they think are out to suervey them. (414) 078-3311. Unfortunately, it is scopred and yet get charged if calling from outside 414 area. The info is almost worth it.

Milwaukee Ring-back- 971, wait for tone, dial 6 and hang up. Loop suffice for 414 area is XXX-0010 &011. They've been closed for a year but someone gets sloppy once in a while. There's a magazine called Amateur Radio 73. It's a ham magazine supposedly published in the Northeast and distributed by ham dealers. The June 1973 issue has an article entitled "Inside Ma Bell" which (according to Wis. Telco newsline) gives "precise technical details on blue box construction." The searchers for a copy, but they were gone quick. You may have better luck in a library.

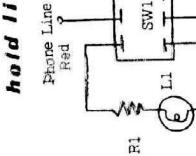

Incidentally Pacific NW Bell is suing the magazine for \$100, 300 for distributing it in their area. Freedom of the Press? Shut.

I "have heard" that some criminally insane persons buy coin holders made for coin collectors and use the quarter and dime size card board discs in these as slugs. Seems these card board discs work in the "slide-in" type coin acceptors used in laundromats and on small vending machines. Apparently they even work in the "slide-in" acceptors that have magnets to reject metal slugs. Although these people have to hunt around for the "wood-grain" type rollers with the card board discs still in them, that doesn't seem to deter them.

### INDIANA

Dear TAP,  
Shown below is a rotating disc flowmeter. This is the type used in gas pumps, fuel oil meters and to measure water used in your house. It is usually found under a round steel plate that says "water" which is located in your yard or in the street, etc. It is held together with 6 or 8 bolts around its circumference. When these bolts are removed

### hold it in

everything in the meter can be removed. This is a positive displacement meter which means for every cycle or revolution of the disc a fixed amount of water is transferred registered on the dial. The fixed amount of water is transferred in a sealed fixed space and carried thru the meter by movement of the disc. Tell your readers that it is illegal to do this but if you were to shave or grind off 1/8" off the outside circumference of the disc and then put it back in, a large amount of water will pass through without registering on the dial. This results in a large savings on registering on the dial. When you pick up,

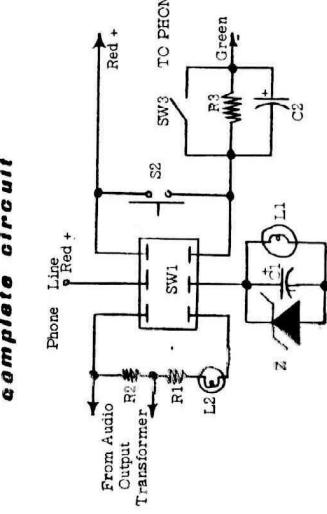

Technical view of typical rotating piston meter.

## CORRECTED SNOOP LITE

The Snoop Light article in Issue #19 listed incorrect values for the bulb and capacitor. The bulb is a #48 screw base or a #49 parabolic base, both 2 volts and 50 mA. The capacitor is a 500 mfd. at 15 volts. The complete circuit operation is as follows: When the phone is on the hook 48 volts DC is across the red and green phone wires. Since the phone is drawing no current now, the snoop light (in series with the green negative line) does not light. Ringing is a 90 volt AC 20 Hertz signal superimposed on the 48 volt phone line. The bulb's cold resistance is small, no appreciable voltage develops across it, so it remains unlit. When you pick up, current flows thru the line and bulb causing it to lite brightly. This large surge is caused by the low 100 ohm phone resistance being switched across the phone line. If you pick up during the ring the voltage is 48 plus 90 volts AC, and so this can be quite a surge. The capacitor opposes the voltage change and helps absorb the surge of current. The bulb will momentarily brighten if you pick up during a ring. To prevent this a zener diode (5 to 10 volts, 1 watt) is added. When the bulb burns out 48 volts is across the zener and it conducts. The zener does not let the voltage across the capacitor exceed 10 volts so the capacitor is protected. Thus a 15V capacitor can be used, instead of 50V, saving space and money.

Remember, the snoop light is not a phone tap indicator, it only indicates that all extensions are hung up. It will not work on a Black Box call. If the snoop light is connected before a hold button it will also light up on hold. The hold resistor is 1.00 ohms 1 watt. If you Soparites want music on hold only pick up between rings. If the phone will go dead, connect the audio output leads of a radio or stereo with Transformer output, to the 10 ohm resistor instead of the speaker it normally goes to. TAP is working on a snoop lite that will work with a Black Box. A schematic will print as soon as possible. Ideas are welcome. Also we need to know if the off-hook current in your area is different from 60 ma. as in New Jersey. A different bulb may be needed for different places.

## complete circuit

### Phone TAP

May 21, 1975 The Real Paper

While we're on the subject, we'd be remiss if we didn't pass along a Berkeley Barb report that phone phreaks in the maximum security prison at Wayside Honor Rancho in Los Angeles have been busted on charges of making long-distance calls using counterfeit credit card numbers. The inmates are accused of running up \$600 in calls. One prisoner had the temerity to charge all his calls to the Chino, California municipal court. Another inmate, according to sheriff deputies, used the phone to call Washington and talk personally to Supreme Court Justice William O. Douglas shortly before Douglas suffered his stroke. And a third inmate, according to police, was actually using the prison phone to talk to friends on the outside to plan robberies. The scheme was discovered when the inmate called a wrong number — that of a police lieutenant.
